"Candida glabrata metallothioneins. Cloning and sequence of the genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -!- SIMILARITY: BELONGS TO THE METALLOTHIONEIN SUPERFAMILY; FAMILY 9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                       Mehra R.K., Tarbet B.E., Gray W.R., Winge D.R.;
"Metal-specific synthesis of two metallothioneins and gamma-glutamyl
peptides in Candida glabrata.";
Proc. Natl. Acad. Sci. U.S.A. 85:8815-8819(1988).
-!- FUNCTION: THE METALLOTHIONEINS ARE INVOLVED IN THE CELLULAR
SEQUESTRATION OF TOXIC METAL IONS.
-!- INDUCTION: BOTH MT-I AND MT-II GENES ARE REGULATED BY COPPER ION
                                                                                                                                                                                                                                                                                                                                                                                               IN A CONCENTRATION-DEPENDENT FASHION, AND BOTH ARE INDUCIBLE BY SILVER BUT NOT BY CADMIUM SALTS.

-1- MISCELLANEOUS: MT-I MIGHT BIND APPROXIMATELY 11-12 MOL EQ OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oryza sativa (Rice).

"Solution structure of mu-conotoxin PIIIA, a preferential inhibitor of
persistent TTX-sensitive sodium channels.";
J. Biol. Chem. 277:0-0(2002).
-:- FUNCTION: Mu-conotoxins bind and block voltage-sensitive sodium
channel. This peptide causes flaccid paralysis in both mice and
fish. It blocks reversibly rat neuronal type II channel, whereas
it blocks irreversibly amphibian muscle Na+ channels (Probable).
-:- SUBCELULIAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Toxin; Neurotoxin; Sodium channel inhibitor; Hydroxylation; Amidation; Cleavage on pair of basic residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -!- TISSUE SPECIFICITY: Expressed by the venom duct.
-!- PTM: EXISTS in two forms, due to cis-trans isomerization at Hyp-8.
Adopts a predominately trans conformation (Probable).
-!- SIMILARITY: BELONGS TO THE M-SUPERFAMILY OF CONOTOXINS. MU-TYPE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

1- FUNCTION: THE KERATIN PRODUCTS OF MAMMALIAN EPIDEEMAL DERIVATIVES
SUCH AS WOOL AND HAIR CONSIST OF MICROFIBRILS EMBEDDED IN A RIGID
MATRIX OF OTHER PROTEINS. THE MATRIX PROTEINS INCLUDE THE HIGH-
SULFUR AND HIGH-TROSINE KERATINS, HAVING MOLECULAR WEIGHTS OF
6-20 kDa, WHERBAS THE MICROFIBRILS CONTAIN THE LARGER, LOW-SULFUR
KERATINS (40-56 kDa).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

SUBUNIT: MONOMER.

DOMAIN: CLASS I METALLOTHIONEINS CONTAIN 2 METAL-BINDING DOMAINS:
POUR DIVALENT IONS ARE CHELATED WITHIN CLUSTER A OF THE ALPHA
DOMAIN AND ARE COORDINATED VIA CYSTEINYL THIOLATE BRIDGES TO 11
CYSTEINE LIGANDS. CLUSTER B, THE CORRESPONDING REGION WITHIN THE
BETA DOMAIN, CAN LIGATE THREE DIVALENT IONS TO 9 CYSTEINES.
SIMILARITY: BELONGS TO THE METALLOTHIONEIN SUPERFAMILY; FAMILY 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: ISOLATED HUMAN PHOSPHOLIPASE PROTEINS,
TITLE OF INVENTION: ISOLATED HUMAN PHOSPHOLIPASE PROTEINS,
TITLE OF INVENTION: ISOLATED HUMAN PHOSPHOLIPASE
TITLE OF INVENTION: ISOLATED HUMAN PHOSPHOLIPASE
TITLE OF INVENTION: UNCLEIC ACID MOLECULES ENCODING HUMAN PHOSPHOLIPASE
TITLE REPERENCE: CLOO00449DIV
CURRENT APPLICATION NUMBER: 08/10/096,961
PRIOR APPLICATION NUMBER: 09/232,632
PRIOR APPLICATION NUMBER: 09/232,632

Sequence 4, Application US/09920897

Patent No. US/2002000489A1

GENERAL INFORMATION:
APPLICANT: Paslin, David A.
TITLE OF INVENTION: ATOPIC DERMATITIS METHOD
FILE REFERENCE: 17761-702

CURRENT APPLICATION NUMBER: US/09/920,897
